INTRODUCTION

This memorandum describes the computer program developed and assumptions used to produce directional trip distribution from a zone. The computer program was designed to provide a summary of the daily vehicle trips to the eight cardinal directions for each of the 1,466 internal zones within the Miami-Dade urban area. The summary generated by the program provides an estimate of travel by direction for each individual zone using the sketch planning technique described below.

DIRECTIONAL TRIP DISTRIBUTION PROGRAM

The cardinal directional trip (CDISTR) program was structured as a stand alone utility program for the Miami-Dade travel demand model chain. The Miami-Dade model was developed with the Florida Standard Urban Transportation Model Structure (FSUTMS) and TRANPLAN (URBAN/ SYS) software. The cardinal directional trip distribution program was developed as a FORTRAN utility to the FSUTMS/TRANPLAN program.

There are three primary inputs required by the CDISTR program, including the number of internal transportation analysis zones (TAZ); the "XY" or geographical coordinate file, which describes the location of each zonal centroid; and a matrix of the daily vehicle trips created after the modal split step in the model chain. The matrix includes the low occupancy vehicle (LOV) trip table and high occupancy vehicle (HOV) trip table of the HTTAB file. The total daily vehicle trips in this file are in a balanced or "origin-destination" (O/D) format, which ensures that the amount of daily trips moving in both directions between a given pair of zones are equal.

The program is designed to identify the direction of travel from each internal zone to all possible destination zones. Trips associated with each of the zonal pairs are assigned to one of the eight cardinal directions as shown on the following page. Each of the cardinal directions consist of a 45 degree angle formed by the intersection of the eight major compass bearings and are defined as follows:

NNE	-	between North and Northeast
ENE	-	between East and Northeast
ESE	-	between East and Southeast
SSE	-	between South and Southeast
SSW	-	between South and Southwest
WSW	-	between West and Southwest
WNW	-	between West and Northwest
NNW	-	between North and Northwest

The direction of each zonal pair (interchange) is defined based upon the differences in X and Y coordinates for each interchange, using the origin zone as a reference point. Once the directions of each interchange are determined, daily total vehicle trips from the Miami-Dade model chain are assigned to the directions. The program then summarizes the number of trips and the percentage by direction and by origin zone.

It should be noted that the directions of travel from a given zone to all other zones are determined only by their centroid location. The program does not consider the actual path of travel to determine the directions of trips. Output should be used considering this limitation of the program.

It should also be noted that the program calculates only the direction of trips originating from a given zone. Hence, the summary includes the "one-way" daily vehicle trips leaving the zone but not the trips entering the zone. To calculate trips to and from a particular zone the values for the eight cardinal directions must be multiplied by a factor of two. However, percentages should remain the same.

PROGRAM APPLICATION

A production run was made using the CDISTR program for the Year 2005 validated daily vehicle trip table. The output for the directional distribution for the Year 2005 validation simulation is provided in **Appendix A**. The CDISTR program can be used for any simulations of future year for changes in land use, and transportation systems. **Appendix B** contains the cardinal distribution report of the 2035 Cost Feasible Plan.

Appendix A.

Miami-Dade 2005 Directional Distribution Summary
